The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid mpGES-1 in chibits its expression; (2) a method of inhibiting the expression of mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and mpGES-1 in cells or tissues, and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiavascular activities, and can ophthalmological, immunomodulatory and cardiavascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Aliahime's

human mpGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8.30 by targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding mpGES-1 in cells or tissues; and (3) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal mpGES-1 in cells or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antistlammatory, neuroprotective, antiatrhitic, vasotropic, antidiabetic, immunomodulator, cardiant, neuroprotective, sactionities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGBS-1; mPGBS-1 inhibitor; microsomal prostaglandin E2 synthase; imPGBS-1; mPGBS-1; inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; discase; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9343.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically thy bytidise with the nucleic acid mpGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal natisense or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, antidiflammacroy, neuroprotective, nootropic, antiarthrities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 explaimmation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or opthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromsome 9, more specifically to pay14.3. The present invention also describes! (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding (mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues, and dishabetic acid encoding having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiant, neuroprotective, copthalmological, immunomodulatory and cardiant activities, and can can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to old an integrated to a nucleic acid encoding maying a sequence comprising 8-30 bp targeted to a nucleic acid mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (3) a method of inhibiting the expression of mpGES-1 in cells or tissues; and anisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiavascular activities, and can confit in a mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ophthalmic, immunological, cardiovascular or neurological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ischaemia or

The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for treating e.g.

           antinfilammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer: disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; acrdiovascular disorder; neurological disorder; se.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mFGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to gene is located on chromosome 9, more specifically to organize mpGES-1 and antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antianflammatory, neuroprotective, nootropic, antianflammatory, neuroprotective, nootropic, antianflammatory, neuroprotective, and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or distinct associated with mPGES-1 e-g., inflammation, all and an antisense compound and antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e-g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chimeric; antisense oligonuclectide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mFGES-1; mFGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; notropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues, and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiavascular activities, and can confitted as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or discontine associated with mpGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; antiinflammation; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; s.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mEGES-1). The human mEGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mEGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mmcGES-1 gene is located on chromosome 9, more specifically to office on the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding medGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal acidsase or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamaticity, neuroprotective, noctropic, antidiamaticy, namunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to pe used as mPGES-1 inhibitors and in gene therapy. The antisense compound condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation, Alzheimer's diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 4; SEQ ID NO 1685; 132pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ischemia.

                having a sequence comprising 8-30 bp targeted to a nucleic acid encoding medESS-1, which specifically hybridise with the nucleic acid meDESS-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, archimit, neuroprotective, antinfilammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological; immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammatory and activities and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunoomodulator; cardiant; neuroprotective; antidilammatory; neuroprotective; natidiammatory; neuroprotective; vasotropic; ophthalmological; immunoomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to gene is located on chromosome 9, more specifically to gray a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal cantisense oligonucleotides and antisense one compounds have cytostatic, antidabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation, a disease or condition associated with mPGES-1 e.g., inflammation in injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 3034.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding mPGES-1, in cells or tissues; and (3) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiavascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically too 9034-3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal aving a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, nootropic, antiarthrities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chimeric, antisense oligonucleotide, phosphorothioate, human, microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antinflammatory;

The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             microsomal prostaglandin E2 synthase, mpGES-1; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective, antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; halbalemer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; acrdiovascular disorder; neurological disorder; ss.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mFGES-1 gene is located on chromosome 9, more specifically to oligan mPGES-1 gene is located on chromosome 9, more specifically to man mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and not mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antinflammatory, neuroprotective, notropic, antisathritic, vasotropic, ophthalmological, immunomodulatory and cardiant activitities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or confident activities and in gene therapy. Alzheimer's confident associated with mPGES-1 e-g., inflammation, Alzheimer's confident activities and action associated with mPGES-1 e-g., inflammation, Alzheimer's confident activities and can be used do the propertice of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1; inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; osotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to human mPGES-1 gene is located on chromosome 9, more specifically to human mPGES-1 and sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cyrostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, contininflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Altheimer's condition associated with mPGES-1 e.g., inflammation, Altheimer's condition associated with mPGES-1 e.g., inflammation, Altheimer's condition associated with mPGES-1 e.g., inflammation, and antisense compound can appear to the condition associated with mPGES-1 e.g., inflammation, and antisense compounds the condition associated with mPGES-1 e.g., inflammation, and antisense compounds the condition associated with mPGES-1 e.g., inflammation, and antisense composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, and antisense composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, and antisense composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, and antisense composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, and antisense composition for treating and antisense comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin B2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin B2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin B2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

```
antidiabetic, immunomodulator, cardiant, neuroprotective, antinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9034.3. The present invention also describes: (1) antisense compounds having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpCES-1). The human mpCES-1 gene is located on chromosome 9, more specifically to 9034.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpCES-1, which specifically Mybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpCES-1 in cells or tissues; and (3) a method of treating an animal mpCES-1 in cells or tissues; and (3) a method of treating an animal mpCES-1 in collisonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpCES-1 inhibitors and in gene therapy. The antisense compound to be used as mpCES-1 inhibitors and in gene therapy. The antisense compound condition associated with mPCES-1 e.g., inflammation, Alzheimer's chabetes, cancer, ischaemia or repertusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 4; SEQ ID NO 1566; 132pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding fatty acid synthase, which inhibit the expression of fatty acid synthase. The antisense oligonucleotides are useful for increasing the metabolic rate, decreasing adiposity, decreasing serum leptin, decreasing serum cholesterol, decreasing blood glucose, decreasing serum insulin, decreasing serum lipids and treating an animal having a disease or condition associated with fatty acid synthase, such as breast, prostate, colon, endometrium, ovary and thyroid cancers. It may also be useful prophylactically, e.g., to prevent or delay infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inflammation or tumour formation. The present sequence represents a human fatty acid synthase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New compound of 8-80 nucleobases in length which inhibits the expression

```
The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding fatty acid synthase, which inhibit the expression of fatty acid synthase. The antisense oligonucleotides are useful for increasing the metabolic rate, decreasing adiposity, decreasing serum leptin, decreasing serum cholesterol, decreasing blood glucose, decreasing serum insulin, decreasing serum lipids and treating an animal having a disease or condition associated with fatty acid synthase, such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     as breast, prostate, colon, endometrium, ovary and thyroid cancers. It may also be useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human fatty acid synthase antisense oligonucleotide.
of fatty acid synthase, useful for treating disease or condition associated with fatty acid synthase such as breast and colon cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 0.4%; Score 15.2; DB 1; Length 20; Best Local Similarity 85.0%; Pred. expression

The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding fatty acid synthase, which inhibit the expression of fatty acid synthase. The antisense oligonucleotides are useful for increasing the metabolic rate, decreasing adiposity, decreasing serum leptin, decreasing serum cholesterol, decreasing blood glucose, decreasing serum insulin, decreasing serum lipids and treating an animal having a disease or condition associated with fatty acid synthase, such as breast, prostate, colon, endometrium, ovary and thyroid cancers. It may also be useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human

hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and disgnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclindependent kinase 6 antisense oligonucleotide. Note: Seqid 15-134 are also used in Tables 1 and 2 (page 30-34) but these sequences do not match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense oligonucleotides targeted to cyclin-
dependent kinase 6, and which inhibit the expression of cyclin-dependent
kinase 6. The antisense oligonucleotides are useful for treating a
disease or condition associated with cyclin-dependent kinase 6, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding cyclin-dependent kinase 6, useful for treating cancer, bacterial/viral infection or conditions involving aberrant

The invention relates to antisense oligonucleotides targeted to cyclindependent kinase 6, and which inhibit the expression of cyclin-dependent kinase 6. The antisense oligonucleotides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and diagnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclin-dependent kinase antisense oligonucleotide. Note: Seqid 15-134 are also used in Tables 1 and 2 (page 30-34) but these sequences do not match

                                                                                                                                                                                                                                                                                               ö
                                                                                               The invention relates to a method for screening drugs using systematic deletion mutants of fission yeast (Schizosaccharomyces pombe). The deletion mutants exhibit a sensitive response to drugs and are created by deletion of a target gene selected from nda2, pspl, pakl, crml, ste<sup>7</sup>, stell, dis3, dis2, rad16, rad24, chkl, cdsl, cdrl and cdc25. Target gene deletion is achieved by homologous recombination with a target gene auxotrophic marker gene), tag sequences, binding sites for universal primers, a restriction site, and target gene specific sequences, primers, a restriction site, and target gene-specific sequences, primers, preferably those encoding N- and C-terminal sequences of the encoded protein. Sequences used in the

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                     The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostice for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2 MOE wings and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          apolipoprotein B; ApoB; cardiovascular; antiarteriosclerotic; antilipaemic; antidiabetic; anorectic; cardiant; vasotropic; hypotensive; anabolic; eating disorder; cytostatic; endocrine; vasotropic; neuroprotective; nootropic; lipid; cholesterol metabolism; hyporlipoproteinaemia; hyperlipidaemia; hyperlipidaemia; hyperlipidaemia; hyperlipidaemia; sexual ateliotic dwarfism; hyperthyroidism; hypertension;

The invention relates to a novel antisense compound where the compound by the invention relates to an inhibits expression of mRNA encoding human applicable and inhibits expression of mRNA encoding human applicable in Culture at a concentration of 150 nM. The confluent HepG2 cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, cardiant, vasotropic, antilipaemic, antidiabetic, anorectic, cardiant, vasotropic, neuroprotective and nootropic activities and may be useful for inhibiting the expression of apolipoprotein B in cells or tissues in vivo in order to address a condition associated with abnormal lipid or cholesterol metabolism. The compound may be useful for eactants and chylomicrons and thus may be utilised during treatment of hyperlipoproteinsemia, hyperlipidaemia, hypercholesterolaemia, cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension, anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia, impotence, obstructive liver disease, Alzheimer's disease, dementia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                breast cancer; cytostatic; gene therapy; human; laminin alpha 4; LAWA4; chromosome 6q21; 88; PCR; primer; SNP; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence is that of

                                                                                                                                                                                                                The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of a PCR primer of the invention which was used to genotype single nucleotide polymorphisms within human laminin alpha 4 (LAWA4) DNA which is located at chromosomal position 6q21.
                          Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= OTHER

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding endothelial lipase. The compound compound specifically hybridises with the nucleic acid molecule encoding conducted living the such as a sequence of 3927 bp fully defined conducted are: inhibiting the expression of endothelial lipase. In the specification) and inhibiting the expression of endothelial lipase. In cells or tissues; screening for amodulator of endothelial lipase; a diagnostic method for identifying a disease state; a kit or assay device compution associated with endothelial lipase; compition associated with endothelial lipase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that conjugonucleotide is useful for inhibiting the expression of endothelial lipase is inhibited. The antisense of coligonucleotide is useful for inhibiting the expression of endothelial lipase expression, such as cardiovascular disease. In addition, the compound is used for diagnostics, prophylaxis, or as tresarch reagents or kits. This sequence represents a mouse endothelial lipase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding endothelial lipase. The compound especifically hybridises with the nucleic acid molecule encoding endothelial lipase (which comprises a sequence of 3927 bp fully defined in the specification) and inhibits the expression of endothelial lipase. Also described are: inhibiting the expression of endothelial lipase; a clist or tissues; screening for a modulator of endothelial lipase; a diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and treating an animal having a disease or condition associated with endothelial lipase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of endothelial lipase is inhibited. The antisense of endothelial lipase is inhibited. The antisense of endothelial lipase is inhibited. The antisense of endothelial lipase as consisted with a coligonucleotide is useful for inhibiting the expression of endothelial lipase expression, such as cardiovascular disease. In addition, the compound is used for diagnostics, prophylaxis, or as the endothelial lipase for diagnostics, prophylaxis, or as the endothelial lipase and the endothelial and the endothelial endothelial control or the endothelial endothelia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

polypopulue (analyof an isolateu nuclear actue depressing the prosperior) an insulin-producing cell comprising a vector (where the vector comprises a nucleic acid sequence encoding an islet cell differentiation teranscription factor), an insulin-producing cell (generated by a method comprising obtaining a somatic cell and transfecting the cell with a comprising a nucleic acid sequence encoding an islet cell with a confident transcription factor, where in the transfecting step the cell produces insulin), a method of generating at least one pancreatic cell produces insulin), amethod of generating at least one pancreatic coll produces insulin) (comprising: NeuroD or ngn3 polypeptide or a polymocleotide expressing a betacellulin polypeptide).

The islet cell differentiation transcription factor polypeptide is comprosed in a polymocleotide expressing a betacellulin polypeptide).

The islet cell differentiation transcription factor polypeptide is cortein), Nkx6.1, IB1-1 (Islet factor 1), Pdx-1 (pancreatic and duodenal conneobox protein), Nkx6.1, IB1-1 (Islet factor 1), Pdx-1 (pancreatic and duodenal cell differentiation transcription factor oplypeptide or its homologue canalogue is useful for treating a mammal for insulin-dependent diabetes, contracting an insulin manner of the paragraphy of paragraphy

The invention relates to the use of an islet cell differentiation transcription factor polypeptide or its homologue or analogue for treating a mammal for insulin-dependent diabetes, increasing an insulin level in a somatic cell, or generating an insulin-producing cell. Also included are a method of treating a mammal for insulin-dependent diabetes, a method of increasing an insulin level in a somatic cell, a method of generating an insulin level in a somatic composition comprising an isolated isset cell differentiation transcription factor polypeptide (and/or an isolated nucleic acid expressing the polypeptide).

Use of an islet cell differentiation transcription factor polypeptide or tits homologue or analog for treating a mammal for insulin-dependent diabetes, increasing an insulin level in a somatic cell, or generating an insulin-producing cell.

primer (AAQ73753) and a 3'-primer (AAQ73754) corresponding to nucleotides 4-23 and 995-1115, respectively, of the promoter sequence. The promoter can be operatively linked to the branching enzyme gene or to heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Specifically designed oligodeoxyribonucleotides form triplexes in single-
or double-strand DNA at homopurine-homopyrimidine targets. These
triplexes block in vitro NNA synthesis by all DNA polymerases studied,
including Sequenase3, Taq, Vent, and Pol I. A similar phenomenon occurs
when DNA polymerases are supplemented with accessory replication
proteins, including SSB protein. Replication blockage is highly sequence-
specific and even one or two point substitutions within either the target
sequence or the oligonucleotide abolish the effect. Sequence-specific
blocking of DNA replication in vivo is facilitated by the methods and
compositions of the present invention. The present sequence is a triplex-
forming oligonucleotide which targets a 185 bp long stretch within the
inverted repeat (IR-L) of herpes simplex virus 1 at position 117156-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence specific inhibition of DNA synthesis - by triplex-forming oligo:nucleotide(s), for detection of oncogene mutation(s) and treatment of e.g. HSV, Hepatitis C and Papillomavirus infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                    can be linked to a heterologous coding sequence to increase tissue-
specific expression of the coding sequence in the spitchilum. These
prods. can be used to treat carcinomas or metabolic disorders such as
phenylketonuria, cystic fibrosis, haemophilia or emphysema. They can also
be used as vaccines against infectious organisms or can confer resistance
to the effects of a chemotherapeutic drug. See also AAQ66988-95. (Updated
on 25-MAR-2003 to correct PN field.)

the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comparises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria; and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that medulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bloactive properties. Information gathered from assays of tractable to a variety of nucleotide sequences that are tractable to a variety of nucleotide sequence based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and ANZ20011 to AAX52106, represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sasmor HM, Brooks DG;
                                                                                                                                                                                                                                                                                             Identification; genetic target; gene modulation; human; probe; antisense oligonucleotide; phosphorothioate; PCR primer; nucleotide sequence-based technology; antisense drug discovery;

```
The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense coligonucleotides may be derived
from sequences AAX5512-4. These multiple target oligonucleotides
from sequences AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
cute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
culmonary vasoconstriction, emphysema, chronic obstructive pulmonary
distress (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, parcer, cancer, papatic metastases,
hepatocellular carcinoma, kidney cancer, metastasize or have metastasized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.4%; Score 15.2; DB 1; Length 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a composition comprising two oligonucleotide analogues, each having a binding domain and a coupling moletty, where the binding domains are capable of hybridizing to a target polynucleotide and the coupling moleties are capable of coupling to each other in the absence of a target molecule. The composition/compound is used to cleave an RNA target. The compositions can be used to determine an optimal antisense site for a given mRNA or an optimal ribozyme cleavage site for a target RNA. By separating the antisense molecules into two or more pieces, a comprehensive antisense library can be prepared in advance, rather than synthesizing a plurality of candidate antisense molecules as needed. A complete library of every possible 17-mer oligonucleotide, using the four natural bases, would consist of 417 or 1010 molecules. By providing the antisense molecules in at least two components, e.g. a library of 8-mers and a library of 9-mers, assembled quickly as needed, the library size is reduced to 48 + 49, or 327 650 molecules. The complexity of the library can be further some of the natural bases. The present sequence represents an oligonucleotide, which is used in an example from the present invention

                                                       Sequences AAX79317-X79320 represent primers useful for detecting the gene
                                                                             encoding a human lymphocytic virus-binding lectin (LVBL, AAX79316). The encoding a human lymphocytic virus-binding lectin (LVBL, AAX79316). The lectin was isolated from HIV-infected CEM cells and has a molecular weight of 47 kD. LVBL gene expression was shown to be enhanced in the presence of an infective HIV strain. Thus antibodies to LVBL can be used to detect the LVBL polympotide and LVBL polymucleotides can be used as primers and probes for detecting LVBL molleic acids, e.g. for diagnosis of a viral infection, especially an HIV infection. Antibodies, vectors and (anti) sense oligonucleotides can be used to prevent or treat a viral infection, especially an HIV infection, or modulate cell proliferation, especially to stimulate proliferation of haematopoietic progenitor cells in the treatment of medullary hypoplasia or aplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human ELK-1; p62TCF; Ets domain transcription factor protein; apoptosis; expression inhibition; infection; inflammation; tumour formation;

AZ06608. Human ELK-1 also known as p62TCF is a member of the terrary complex factor subfamily of Ets-domain transcription factor proteins. Ar106081-206607 inhibit the expression of ELK-1 welleicacid molecule AAZ06571-206607 all cause at least 30% inhibition of ELK-1 expression. The antense sequences can be used to inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to control various signal transduction pathways and other cell functions including apoptosis. This means that antisense compounds inhibiting expression of ELK-1 can be used to treat disease associated with its expression in animals, particularly humans and to prevent or delay infection, inflammation or tumour formation. The compounds can also be used for diagnosis, as research reagents and in kits
                                                                                                                                                                                                                                                                                                                                                                                                                                                   primers AAZ06609-Z06610 are used to amplify the human ELK-1 sequence
                                                                                                                                                                                                                                                                                                                                                    Antisense compound useful for diagnosis, treatment and prevention of disease associated with ELK-1 expression.

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hyperrension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 539; 1343pp; English.

```
The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets conclete acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antivillammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating ceffects afflict the lungs of a subject. They can be used for treating impaired respiration, respiratory desconsitiction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cysic fibrosis, pulmonary hypertension, emphysema, chronic obstructive continuously hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the Non reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing conchoconstriction and inflammation. AAA3313 to AAA35312 represent the invention, which correspond to SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:1 to 185, but the sequences creations, named sequences sEQ ID NO:1 to 185, but the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. Sequences given in the disclosure of the present invention. N.B.

The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense coligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ungivespiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoslobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central creceptors, adenosine receptors, bradykinin receptors, central creceptors, adenosine receptors, bradykinin receptors, central creceptors, defensins, growth factors, vascative peptides and receptors, bradykinin receptors central creceptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergic syndrome condition selected from pulmonary vasoconstriction, inflammation, cultanged respiratory vasoconstriction, inflammation, condition, cystic fibrosis (CP), allergic rhinitis (AR), pain, cystic fibrosis (CP), allergic rhinitis (AR), pain, cystic fibrosis (CP), cystic fibrosis (CP), cystic fibrosi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                              respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
  surfactant hypoproduction; pulmonary vasoconstriction, asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhir

```
The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one such polymorphic locus used in the present invention. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to form the oligonucleotide array. Note: This sequence includes a SNP represented by the degenerate codon in the
                                                                                                                    Oligonucleotide array; genotyping; single base extension reaction; SBE; polymorphic locus; single nucleotide polymorphism; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel human NOVX proteins and coding sequences, where X is any number from 1 to 18 (see AAH75716-AAH7573), and AAG64400 and AAG66322-AAG66338). NOVX are members of the AAH75733, and codorant/Olfactory receptor (ONY family, which are G-protein coupled receptors (GPCRs). The NOVX proteins and coding sequences are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human diseases/disorders of the neuro-olfactory system, e.g. those induced by trauma, surgery and/or neoplastic disorders. Purthermore, the coding sequences and proteins are useful in treating cancer e.g. adenocarcinoma, lymphoma, prostate cancer, uterus cancer, inappropriate immune response, AIDS, asthma, Crohn's disease, multiple sclerosis or AAbright hereditary oteodystrophy. The coding sequences are also useful in gene therapy for treating the above conditions. The present probe was used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New NOVX polypeptides and polynucleotides, useful for treating or preventing a syndrome associated with a human disease (e.g. disorders of the neuro-olfactory system), as well as in gene therapy.

DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs) A method is included in the invention for analysing a nucleid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection heart microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as
                                                                                                                                                                                                                                                  a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis

DNA sequences AAH62100 - AAH6268B represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites of diagnosis or monitoring any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaccutical. SNP containing oligonucleotides are useful in medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Revised record issued on 09-SEP-2004 : Correction to Feature Table Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analyzing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites of the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in embalications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Revised record issued on 09-SEP-2004 : Correction to Feature Table Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neonate screening; prenatal screening; gene chip; diagnosis; phenylketonuria; maple syrup disease; galactosemia; homocysteinuria; mediuu-chain acyl-coA-dehydrogenase deficiency; biotinidase deficiency; familial hypercholesterolemia; familial defective apolipoprotein-B; cystic fibrosis; Marfan syndrome; Smith-Lemil-Opitz syndrome;

                                                                                                                                                                                                      This invention describes a novel nucleotide support (A; gene chip) which carries a selection of oligonucleotides (I) that are identical, or complementary, to segments of reference sequences relevant to at least two genetically determined phenotypes. (A) are used for simultanneous diagnosis of at least two of the following diseases; phenylketonuria (maple syrup disease), galactosemia, homocysteinuria, biotinidase deficiency, medium-chain acyl-CoA-dehydrogenase deficiency, familial hyperchholesterolemia, familial defective apolipoprotein-B, cystic fibrosis, Marfan syndrome. Smith-Lemil-Opliz syndrome and androgenital syndrome. Specifically they are used in neonatal or prenatal diagnosis. (A) require a relatively small number of separate hybridization regions (about 500 for testing for any diseases. Testing is quick, inexpensive, reliable, and more sensitive than current physiological methods. Ad488888.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Virus with specific reproduction in a tumor well and effective expression of tumor angiogenesis inhibitor and its construction method.

The invention relates to developing a virus with highly-effective expression of tumour vascular genesis inhibiting factor. The virus comprises a nucleotide sequence encoding the vascular genesis inhibiting factor inserted into a non-essential proliferation region of a virus gene group. The virus selectively proliferates in a tumour cell such that along with replication of virus, the nucleotide sequence copy number of the encoded vascular genesis inhibiting factor is increased. The expression of the vascular genesis inhibiting factor inhibits tumour vascular development and inhibits formation, growth and transfer of tumour. The present sequence is that of a PCR primer, useful to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; FCTRX; myelogenous leukaemia; carcinoma; melanoma; glioma; ss; astrocytoma; congenital neonatal alloimmune thrombocytopaenia; infection; neurological disorder; neurodegenerative disorders; nerve trauma; familial myelodysplastic syndrome; Charcot-Marie-Tooth neuropathy; demyelinating Gardner syndrome; familial myelodysplastic syndrome; mental health condition; immunological disorder; allergy; infertility; bronchial asthma; Avellino type eosinophilia; lung disease; deafness; reproductive disorder; sprocherin Ia deficiency; desmoid disease; turcot syndrome; liver cirrhosis; hepatitis C; virucide; gastric disorders; pancreatic disease; Schistosoma mansoni infection; Spinocerebellar ataxia; Plasmodium falciparum parasitaemia; diabetes; corneal dystrophy-Greonow type I; Corneal dystrophy-lattice type I;

carcinomas, melanomas, astrocytomas, congenital neonateal alloimmune thrombocytopaenia, neurological disorders, neurodegenerative disorders, neurodegenerative disorders, neurodegenerative disorders, neurodegenerative rooth neuropathy, demyelinating dardner syndrome, familial myelodysplastic syndrome, mental health conditions, immunological disorders, allergy and infection, bronchial asthma, Avellino type cosinophila, lung diseases, reproductive disorders, infertility, male and female reproductive disorders, desfiness, glycoprotein la deficiency, desmoid disease, turcot eyndrome, liver cirrhosis, hepatitis C, gastric disorders, pancreatic diseases such as diabetes, Schistosoma mansoni infection Spinocerebellar ataxia, Plasmodium falciparum parasitaemia, formeal dystrophy-Grenonuw type I, Corneal dystrophy-Grenonuw type I and Reis-Bucklers corneal dystrophy-This sequence represents a probe in DNA encoding FCTRS, a protein bearing sequence homology to human complement
                                                                                                                                           The invention relates to human FCTRX polypeptides, FCTR1-FCTR7, and the nucleic acids encoding them. These sequences are useful for the treatment or prevention of numerous disorders including myelogenous leukaemia,
                                        Novel polypeptides designated as FCTRX polypeptides, useful in detection, prevention and treatment of a broad range of pathological states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hormone-regulated cancer, antisense oligonucleotide, IGFBP-2; insulin-like growth factor binding protein-2; hormone-regulated tumour; breast cancer; prostate cancer; IGF-1-sensitive cancer; apoptosis; hormone-responsive cancer; hormonal withdrawal; oligodeoxynucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for treating hormone-regulated cancer, particularly of prostate or breast, comprises oligonucleotide antisense to insulin-like growth factor binding protein-2.

                                                                                                                                                                                                                                                                                                           ö
                 The present invention relates to a new composition for treating hormonerequiated cancer. The composition comprises an antiense oligonuclectide that inhibits expression of IGFBP-2 (insulin-like growth factor binding protein-2). The molecules of the invention are used to delay progression of hormone-regulated tumours, particularly of breast or prostate, to the hormone-independent state, to delay metastatic progression to the bone of IGF-1-sensitive cancers and to treat hormone-responsive cancers by inducing apoptosis, after hormonal withdrawal. The present nucleic acid sequence represents one of a collection (ABR70313-ABR70375) of antisense IGFBP-2-oligodeoxynucleotides (ODN) that were used in the invention for prostate and other endocrine tumour therapy

affinity for a ligand than wild-type T cell receptors (TCRs). TCRs are used, generally in the same way as antibodies, to identify ligands, to bind a selected peptide/MHC (major histocompatibility complex) ligand, as diagnostic probes for specific peptide/MHC molecules on cell surfaces, e.g. for diagnosing particular types of cancer or, in imaging, to locate and estimate size/number of tumours, also for diagnosis of many neoplastic diseases, to block autoimmune destruction of cells, to treat protozoa) T cells that include a gene for their receptors are used for recognition of selected peptide/MHC bearing cells. The present sequence is a yeast VbetaCDR3 (complementarity determining region) mutant peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an insulin regulator construct comprising a glucose response element (GIRE) of a liver pyruvate kinase (LPK) gene promoter and an insulin-sensitive element (ISE) of an insulin-like growth factor binding protein-1 (IGFBP-1) basal promoter. The construct is used to treat or prevent diabetic complications, to regulate insulin production, to modulate hyperglycaemia (without severe hypelypagmenia), to increase fat catabolism and creazed protein catabolism. The construct provides stimulation of insulin expression by glucose (but not other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glucose response element; GIRE; liver pyruvate kinase; LPK; ss; IGFBP-1; insulin-sensitive element; ISE; basal promoter; hyperglycaemia; insulin; insulin-like growth factor binding protein-1; hypoglycaemia; glucose; fat catabolism; protein catabolism; carbohydrate; glucocorticoid; human; glucagon; euglycaemia; diabetes; fasting; ketogenesis; ketoacidosis; phepatocyte; heptoma; cellular protein degradation; antidiabetic; primer; intracellular hormone receptor; insulin regulator construct; anabolic; reverse transcriptase; RT-PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New insulin regulator cassette, useful e.g. for treating diabetes, provides specific, glucose-inducible transgenic expression of insulin in

```
carbohydrates) and glucocorticoids and inhibition by glucagon so that a combination of these effects can maintain nearly euglycaemic conditions in diabetics during short-term feating, large carbohydrate loads or when fed ad libitum and prevent pathological ketogenesis and ketoacidosis, thus inhibiting the long-term complications of diabetes. The properties of the construct are essentially specific for hepatocytes and well-differentiated hepatoma lines and insulin expression in these cells may have effects additional to those provided by secreted insulin, e.g. inhibition of cellular protein degradation, and inhibition, or stimulation of other intracellular hormone receptors. This sequence represents a reverse transcriptuse PCR (RT-PCR) primer used to amplify human insulin, used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 3 A; 7 C; 7 G; 4 T; 0 U; 0 Other;

WPI; 2002-698522/75.

Isolated nucleic acid molecules having polymorphisms in known human genes eg. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traitis.

```
this invention relates to the Sequence or an isolated nuclear action molecule comprising at least one base variation from that of a known controlled by the control of the comprising at least one base variation from that of a known correction receptor betail (ADBRI), cytochrome P450 02E1 (CYP45002E1), adrenatic receptor betail (ADBRI), aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (AANT), cathepsin S (CTSS), cyclooxegenses 2 (COX2), diazepam binding inhibitor (DBI), epoxide hydrocylase 2 (EPHX2), 5-lipoxygenase activating thibitor (DBI), epoxide hydrocylase 2 (EPHX2), 5-lipoxygenase activating transferase (HNMT), MADPH quinome oxidoreductase 2 (MQ2)) histamine-N-methyl transferase (HNMT), MADPH quinome oxidoreductase 2 (MQ2)) histamine-N-methyl transferase (UGT2BI), urokinase receptor (UPA), multidrug resistance 1 (UGT2BI), upp-glucuronosyl transferase 2 (MQ2), cyphan nuclear receptor (NRI2), or acetylcholine muscarinic (MRB1), orphan nuclear receptor (NRI2), or acetylcholine muscarinic creeptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR4 or CHMR4 or CHMR5) sequence. Creeptor 1, 2, 3, 4, or 5 (CHMR1), or acetylcholine muscarinic creeptor (Linkage markers for locating and characterising the genes that creeptor 1, 2, 3, 4, or 5 (CHMR1), creating the genes responsible for avariety of disorder-related creeptor (CT traits as a result of their e.g., overexpression, occitained in CTP4501A1, CTP4501A2, CTP4501A2, and/or treating the disorders. The nucleic acid molecules comprising the and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences ontained in CTP4501A1, CTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                      This invention relates to the sequence of an isolated nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 21 BP; 4 A; 2 C; 13 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                           The invention comprises a reproductive recombination virus capable of killing specifically tumour cells associated with Epstein-Barr (EB) virus. The virus of the invention comprises an insertion of a target gene into the non-reproduction-requiring domain in the virus gene group (the target gene is a cancer-suppressing gene, vascular inhibition gene, cell factor gene, prodrug-converting enzyme gene or cell death gene). The reproductive recombination virus of the invention is useful for treating nasopharyngeal cancer, Hodgkin's lymmhomma and gastric cancer. The present DNA sequence was used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New PR Family Member 2 oligonucleotide, useful for preparing a composition for modulating cell growth for treating cancer or diseases of cell degeneration, e.g., Alzheimer's disease or insulin-dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, PR Family Member 2; PFM2; PFM PR domain, PFM zinc finger domain, PFM ZF domain, modulation of cell growth; cancer; cell degeneration disease, Alzheimer's disease, Parkinson's disease, insulin-dependent diabetes mellitus; IDDM; neuroprotective; antidiabetic; cytostatic; RT-PCR;
                                                                                                                         Construction of reproductive recombination virus able to specifically kill Epstein-Barr associated tumor cells, useful in drugs for treating e.g. nasopharyngeal cancer, Hodgkin's lymphoma and gastric cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The methods are useful for detecting the presence or absence of target nucleic acid sequences on sample nucleic acid strands that are characteristic of pathogens or genevariations and mutations relating to human leukocyte antigen (HLA) or Techl receptor gene sequences, e.g. for HLA tissue typing detecting genetically inherited diseases or detecting infectious organisms in tissues. The diagnostic probes are useful for detecting the presence of particular target nucleotide sequences. The present invention provides improved methods of detecting sample/target nucleic acid sequences, where the use of diagnostic probes having increased specificity reduces the number of alleles detected, which increases the resolution of the method,
                                        The present invention relates to the isolation of human and mouse PR Family Member (PFM) proteins, and the polymucleotide sequences encoding them. Also disclosed are PFM PR and PFM zinc finger (ZF) domains, and the polymucleotide sequences encoding them. The invention also discloses PFM oligonucleotides and methods for detecting a PFM polymucleotide sequence in a sample. The PFM polypeptide and polymucleotide sequence for preparing a composition for modulating cell growth for treating cancer or diseases of cell degeneration, e.g. as Alzheimer's disease, Parkinson's disease or insulin-dependent diabetes mellitus (IDPM). The

New FCTRX polypeptide and encoding polynucleotide, useful for preventing or treating FCTRX-related disorders, such as cancer, autoimmune, neurodegenerative, gastrointestinal, reproductive and inflammatory

The invention relates to FCTRX polypeptides and the polynucleotides encoding them. The sequences of the invention are useful for the

Example 2; Page 146; 155pp; English.

diseases.

```
manufacture of a medicament for diagnosing and treating disorders associated with the FCTRX polypeptide, such as colorectal cancer, adenomatous polyposis coli, wpelogenous leukaemia, congenital neonatal autoimmune thrombocytopenia, malignant ovarian tumours, malignant brain tumours, mammary tumours, malignant ovarian tumours, malignant brain carcinoma, breast adenocarcinoma, ovarian carcinoma, melanomas, clear cell and granular cell carcinoma, novarian carcinoma, melanomas, clear cell and granular cell carcinoma, nevelogical disorders, contrological disorders, nevel trauma, familial myelodysplastic syndrome, Charcot Marie-Tooth neuropathy, Gardner syndrome, mental health conditions, immunological disorders, allergy and infection, asthma, lung diseases, male and female reproductive disorders, dasfness, glycoprotein deficiency, desmoid tumour, turcot syndrome, liver cirrhosis, hepatitis correction, spinocerebellar ataxia, plasmodium falciparum infection, infection, spinocerebellar ataxia, plasmodium falciparum infection, crepresents a probe used to detect cDNA encoding an FCTRX polypeptide of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises a human antibody for inhibiting platelet aggregation by its exclusive binding to the activated state of platelet integrin receptor GPIDA/IIIa. The antibody of the invention is useful for preparing a diagnostic composition for determining the number of activated thrombocytes or for blocking the platelet integrin receptor on thrombocytes. The antibody of the invention is useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antibody, useful for preparing a composition for determining the number of activated thrombocytes or for blocking the platelet integrin receptor on thrombocytes for treating e.g., thrombosis or myocardial

The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo. The separated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene is also detecting the single nucleotide polymorphisms in human gene is also effective in detecting single for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotide useful for detecting single nucleotide polymorphisms
thrombosis or myocardial infarction. The present DNA sequence represents a PCR primer that was used in an example of the invention.
                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human; single nucleotide polymorphism; microarray; side effect; ss;

(sinA) molecule that down-regulates expression of an endogenous mammaliantarget gene comprising one or more chemical modifications and each strand of the double-stranded sinA comprises about 21 nucleotides. The sinA of the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, dissue or organism. The disease or condition may include pulmonary disease such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-RNA hybrid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a double-stranded short interfering nucleic acid

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the instraion codon, coding regalon, 5' or 3' end genomic flanking regions, c' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entill ammatory steroid in a subject, for reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed are for interval and the printed are formal and the printed and the formal and the formal directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating ailments associated with impaired

The invention relates to an antisense oligonucleotide comprising a domain that recruits an RNase and inhibits the function of a gene associated with a human disease, where the improvement comprises incorporation of two juxtaposed universal bases in the oligonucleotide. The antisense oligonucleotides are used for treating cancer associated with an overexpression of the B cell lymphoma-associated gene (BCL2), STAT3, HER-and focal adhesion kinase (PAK), melanoma and inflammatory diseases associated with an expression of tumour necrosis factor (TNF-alpha), and for inhibiting function of a gene associated with a human disease. This sequence represents a human antisense oligonucleotide used in the scope
                                                                                                                                                                                                                                                                                                                                                                                                                                     comprises at

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiniflammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The composition or a vailability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The cultinammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated conflammation, allergies, asthma, independent engine content of the anti-sense oligos corresponding to the main frame into the target RNA serves to prevent the breakdown of the charget parameter of the midles present in the target RNA serves to prevent the breakdown of the conflammation and or prevent the breakdown of the particular and or prevent the present in the target RNA serves to prevent in the carget RNA serves to prevent in the carget RNA serves to prev

```
The present invention describes a modified reductase (I) isolated from Penicillium citrinum comprising: (a) a sequence of 325 amino acids (SEQ CC ID NO: 1, ADH44214) having a substitution at amino acid position 54 and/or 104; or (b) an amino acid sequence of (a) having further deletion, and/or 104; or (b) an amino acid sequence encoding the amino acid sequence encoding the amino acid sequence encoding the amino acid sequence of the reductase defined above; (2) a vector comprising the polynucleotide; (3) a transformant comprising the polynucleotide or vector; (4) producing (S)-4-halo-3-hydroxybutyrate ester by reacting 4-compression (S) material; (5) modified (S)-4-halo-3-hydroxybutyrate ester by reacting 4-complexity (B) modified enzyme gene by substituting at least one single material; (5) modified enzyme gene by replacing at codon that corresponds to producing a modified enzyme gene by replacing a codon that corresponds to at least one of the amino acide of the positions 54 and 104 of SEQ ID NO: 1 with a codon that corresponds to another amino acid(s) in a nucleotide sequence that encodes SEQ ID NO: 1. The modified reductase can be used for reduction reaction, specifically reduction reaction of beta-keto acid, and in organic synthesis reaction for the production of compounds used as active ingredients of medicaments, agrochemicals or their intermediates, especially optically active compounds. The present

```
The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ss; probe; NOVX; autoimmune disease; Alzheimer's disease; stroke; allergy; Parkinson's disease; multiple sclerosis; anxiety; pain; diabetes; graft Hersus host disease; pancreatitis; obesity; uloer; anaemia; cancer; viral infection; bacterial infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New PR family member nucleic acid and polypeptide, useful for diagnosing, preventing and treating proliferative disorders, such as cancer, scleroderma, arthritis or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention provides novel PR family member (PFM) polypeptides and polynucleotides. These sequences are characterised by encoding or containing a PR domain and a zinc finger (ZF) domain. The PFM nucleic acid molecules, oligonucleotides, polypeptides and peptides are useful for modulating cell proliferation, diagnosing, preventing and treating proliferative disorders (e.g. cancer, scleroderma, arthritis, alcoholic liver cirrhosis, keloid and hypertrophic scarring or atherosclerosis) or disorders of cell degeneration (e.g. Duchenne's muscular dystrophy, insulin-dependent diabetes mellitus, Parkinson's disease, Huntington's disease, Alzheimer's disease or paralysis). PFM nucleic acid molecules are useful as probes and primers to detect PFM nucleic acid molecules are useful as probes useful in gene therapy. The present sequence is human PFM DNA amplifying PCR primer.
                                                                                                                                                                                                                                                           arthritis, alcoholic liver cirrhosis, keloid, hypertrophic scarring, atherosclerosis, cell degeneration disorder; Duchenne's muscular dystrophy; insulin-dependent diabetes mellitus, Parkkinson's disease, Huntington's disease, Alzheimer's disease; paralysis, gene therapy; human; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Disclosure; SEQ ID NO 366; 218pp; English. retinopathy and cancer. WPI; 2004-203472/19. The invention fraintes to an isolated who purpoperate to the invention fraintes to an isolated having at least 95% sequence comprising the mature form, a sequence having at least 95% sequence identity to NOVX or a sequence comprising one or more conservative as ubstitutions in the amino acid sequence of NOVX. Also included are a composition comprising who acrier, a kit comprising, in one or more containers, the composition, a method of identifying an agent that binds to NOVX, a method for identifying a potential therapeutic agent for use in treatment of a pathology related to aberrant expression or aberrant physiological interactions of NOVX, a method for screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a method for modulating the activity of NOVX, a method for modulating the nucleic acid molecule a cell comprising the vector comprising the nucleic acid molecule, a cell comprising the vector, an antibody that immunospecifically binds to NOVX, a method of producing NOVX (comprising culturing the presence of or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a sample, a method for determining the presence or amount of NOVX or the under conditions that lead to expression of the polypeptides or expression of NOVX or the polypeptides cueful in the manufacture of a medicament for treating a syndrome conditions that lead to expression of the polypeptides cueful in the manufacture of a medicament for treating a syndrome associated with a human disease associated with NOVX. The polypeptides and nucleic acid molecules are useful in diagnosing, treating or all presence or and nucleic acid molecules are useful in diagnosing, treating or all presence or and nucleic acid molecules are useful in diagnosing the polypeptides. preventing diseases or conditions, e.g. autoimmune disease, Alzheimer's disease, stroke, allergies, Parkinson's disease, Huntington's diseases, multiple sclerosis, anxiety, pain, diabetes, graft versus host disease, pancreatitis, obesity, ulcers, anaemia, cancer, viral or bacterial and parasitic infections (many more diseases and disorders are listed in the specification). The present sequence is a primer or probe included in the sequence listing but not mentioned anywhere else in the specification.

```
This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit can dendicensis. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (WEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain cegion) genes; as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and cherraped of the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic gent is useful for treating diseases associated with analogenesis and the overexpression of VEGF, which include diabetic retinopathy, agenciated macular degeneration, inflammatory disease, psoriasis and reherapeutic related macular degeneration, inflammatory disease, psoriasis and reherapeutic cancers including breast, retinoblatema, wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antiinflammatory, antipsoriatic, antidiabetic, antidiabetic antiarthritic activities. This oligonucleotide is a human Flt-1 DNA coligo.

interfering RNA (sirRNA) molecules, which can be used to inhibit angiogenesis. Specifically, it refers to siRNAs that target and cause angiogenesis. Specifically, it refers to siRNAs that target and cause RNA-induced degradation of mRNA from human vascular endothelial growth factor (VEGP), the VEGP receptor (FL-1) and the FIR-1/KDR (Kinase domain region) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic ageraded. As such, siRNA administered in combination with a therapeutic degraded. As such, retaining diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, age-related macular degeneration, inflammatory disease, psoriasis and cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antiinflammatory, antipsoriatic, antirheumatic and antiarthritic activities. This oligonucleotide is a human Flt-1 DNA coligo, a target for siRNA inhibition of the invention. This invention relates to novel compositions that comprise short

Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic

The present invention relates to a method for identifying a BBB (bloodbrain barrier)-specific protein, or its fragment, in endothelial cells of brain barriers (brain microvessel endothelial cells, BMEC). The method comprises conventional pre-purification of BMEC, freshly isolated from the brain by enzymatic digestion, treating the digest with a lysis buffer that destroys erythrocytes and apoptotic cells but retains at least 70% or EMEC in viable form, optionally further purification of the product, preparing subtractive cDNA libraries from BMEC and a subtractive tissue, cerifying clones from the subtracted cDNA banks with respect to expression, completing BBB-specific cDNA clones, and comparing expression cerifying clones from the subtracted cDNA clones, which are useful for identify BBB proteins or their fragments. The method is useful for identifying BBB-specific proteins which are useful for transporting substances across the blood-brain barrier and for treatment and diagnosis of diseases (none indicated) associated with dysfunction of this barrier. The method is simple, is performed under mild conditions and provides or machinging in haring that are produced, predeminantly consorting the analysiucus is dentification of proteins that are produced, predeminantly consorting the procession of proteins that are produced, predeminantly consorting the procession in the procession of proteins that are produced, predeminantly consorting the procession of proteins that are produced, predeminantly consorting the procession of proteins that are produced, predeminantly consorting the procession of proteins that are produced, predeminantly consorting the procession of the procession of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying blood-brain barrier protein, useful e.g. as drug transporter and for treatment or diagnosis, by subtractive hybridization using cDNA from brain capillary cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        predominantly

This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein Kinase MRCKI gene located by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase. related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted equence data he human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human protein kinase MRCK1 with 65% sequence homology to rat myotonic dystrophy kinase-related Cdc42-binding kinase (MRCK), useful in diagnostics and as a drug target.
                                                                                                                                  protein kinase; MRCK1; myotonic dystrophy kinase; Cdc42 binding kinase; MRCK; kinase-related disease; short inhibitory RNA; siRNA; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein kinase; MRCK1; myotonic dystrophy kinase; Cdc42 binding kinase; MRCK; kinase-related disease; short inhibitory RNA; siRNA; ds; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.4%; Score 15.2; DB 1; Length 21;

The oligoribonucleotides are useful for down-regulating the expression of the RI-alpha subunit of protein kinase A, reducing growth of cells expression of the Allpha/PKA, detecting overexpression of the RI-alpha subunit of cancer cells. The present sequence represents an oligoribonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Poly-DNP-RNA-21 5-base mismatched strand oligoribonucleotide SEQ ID NO:9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            вв; oligoribonucleotide; RI-alpha subunit; protein kinase A; cytostatic;

```
This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for disgnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                      New human protein kinase MRCK1 with 65% sequence homology to rat myotonic dystrophy kinase-related Cdc42-binding kinase (MRCK), useful in diagnostics and as a drug target.

This invention relates to a novel isolated polymucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI gene encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for disgnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this patent did not form part of the printed appecification but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New human protein kinase MRCK1 with 65% sequence homology to rat myotonic dystrophy kinase-related Cdc42-binding kinase (MRCK), useful in diagnostics and as a drug target.

SEQ ID NO 154; 92pp; English.

(II) or (Ia) and includes the positions 303 and 311 of (4); nucleic acid (III) that encodes (I), (Ia) or (II); an antibody (Ab) directed against (II) or (Ia); methods for determining a tendency to develop type 1 diabetes; transgenic non-human mammal (A) in which the germ and somatic cells contain a nucleic acid (or segment) encoding a 411 as sequence (2), or sequences with at least 95, best 99% homology, where the homologue includes 303Met and 311Arg; best 99% homology, where the homologue includes 303Met and 311Arg; best 99% homology, where the homologue includes 303Met and 311Arg; homologues of the viral methods are useful for that are protective against diabetes. The methods are useful for treatment of factor. (I), or its homologues and peptides, also nucleic acids encoding them and antisense oligonucleotides, are useful for treatment of type 1 and 2 diabetes, autoimmune diseases, cancer and disorders of mineral and lipid metabolism. Detecting mutations in the human analogue of (4) is used to determine a predisposition for these diseases. Transgenic animals that contain the sequence encoding (4), or its homologues, are used to screen for agents protective against diabetes. This sequence represents a primer associated with the isolation and analysis of yin yang-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a protein variant of the Yin Yang-1 transcription factor (1), having a 411 amino acid (aa) sequence (4) reproduced. Also described are: protein (1a) that is a homologue of (4) and includes Arg a position 303 and Lys at position 311; peptide (II) that is a fragment of (1) or (1a) and includes the positions 303 and 311 of (4); nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     variant of the Yin Yang-1 transcription factor, useful for treating . diabetes and autoimmune disease, also for diagnosing predisposition in screening for therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

(III) that encodes (1), (Ia) or (II); an antibody (Ab) directed against (1) or (Ia); methods for determining a tendency to develop type 1 diabetes; transgenic non-human mammal (A) in which the germ and somatic calls contain a nucleic acid (0 to segment) encoding a 411 as sequence (2), or sequences with at least 95, best 99% homology, where the homologue includes 303Met and 311Arg; and use of (A) to screen for compounds (B) that are protective against diabetes. The methods are useful for modulating activity of the YY1 (Yin Yang-1) multifunctional transcription factor. (I), or its homologues and peptides, also nucleic acids encoding them and antisense oligonucleotides, are useful for treatment of type 1 and 2 diabetes, autoimmune diseases, cancer and disorders of mineral and lipid metabolism. Detecting mutations in the human analogue of (4) is used to determine a predisposition for these diseases. Transgenic animals that contain the sequence encoding (4), or its homologues, are used to screen for agents protective against diabetes. This sequence represents a primer associated with the isolation and analysis of yin yang-1

comprises hybridising a polynucleotide probe comprising a segment complementary to a non-repetitive region and a segment complementary to an adjacent repetitive region, where the second segment consists of a defined number of repeats, and determining the melting point temperature of the hybrid. The method is used to analyse microsatellites, especially hereditary tumours. Alternatively, the method is used to identify an individual in a population. The present sequence is a probe for Mononucleotide repeat locus BAT25, and was used to illustrate the

New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.

Example 1; Fig 3; 90pp; English.

The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (1) for CD40 ligand, having residues 313-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding antirheumatic, lamunosuppressive and antirhilammatory activities, and can be used in gene therapy. (1) is useful in the study, diagnosts and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention

The present invention describes an isolated, purified nucleic acid, which residues 311-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, antirhematic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD401, is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD401 poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                          New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.
                                                                                     Human; CD40L; promoter; CD40 ligand promoter; rheumatoid arthritis; diagnosis; antiarthritic; antirheumatic; immunosuppressive; antiinflammatory; inflammatory disease; autoimmune disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 15.2; DB 1; Length 29;

The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (1) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAF74965 where A in the wild type sequence at position 331 (corresponding to position -1255) is replaced with C. (1) has antiarthritic, antirhematic, immunosuppressive and antinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention

New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.

AAF74921;

1 label, immobilising ON and PN hybrids (modified with 2 different labels nor 1 label) to the solid phase and detecting immobilised ON or PN, or the non-immobilised labelled product, directly or via an enzyme labelled antibody. The method can be used to detect specific mRNA in human, animal or plant samples. The method is easy to perform and suitable for quantitation, does not require preliminary RNA isolation, can be made quantitative and has a low background. (Updated on 25-MAR-2003 to correct PR field.)

The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 311 (corresponding to position -125) is replaced with C. (I) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                   Gaps

(I) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence is a PCR primer for synthetic full length CAT sense determination of specific oligonucleotides (ON) or polynucleotides (PN). The method comprises combining a sample containing RNA or single stranded DNA with a lysis/hybridisation buffer, treating the homogenised solution with 1 or more probes, which are essentially complementary to the ON or PN and contain at least 2 different labels, one a specific binding group and the other a detectable chemical group, hybridising under stringent conditions, diluting the mixture and adding an agent that cleaves single stranded nucleic acid into monucleotides or ON, transferring the mixture to a vessel or well, coated with a substance that binds at least

Detection and quantitation of nucleic acid using probe with label and binding group - and after hybridisation treatment with RNase and capture on solid phase, particularly for RNA.

isolating a nucleic acid having a homopolyments sequence or repetitive element or conserved nucleotide sequence. (M1) comprises treating a semple containing nucleic acid compounds with an locked nucleic acid apply of the containing an uncleic acid compounds with an locked nucleic acid acid having the homopolyments sequence or repetitive element or conserved nucleotide sequence. (M1) is useful for detecting and isolating nucleic acids released from a lysed complex bological mixture comprising nucleic acids. The present sequence is a LNA capture probe, used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting and/or isolating nucleic acid molecule having homopolymeric sequence or repetitive element or conserved nucleotide sequence involves treating sample containing nucleic acid compounds with locked nucleic
